Part D Notes

This past week I filled out the needed mathematical functions, as described in the paper. See functions in SimFunctions and the new filled in functions in Pitch. Some "getters" still need to be created. Next, all functions need to be put together into a working simulation (instead of a collection of math equations).

I have set up where my extension will go, but have not fully implemented it. The only other thing to note is that, as of right now while writing this document, I have not actually finished filling out every function needed in the simulation. By end of today, however, I should be done – if I do not finish, I will create a short follow up stating which equations I still need to code.

Goals for Part E:

- Piece together simulations to obtain preliminary results
- Debug
- Fully integrate extension
